

ECE 251 Assignment #1 Addendum: Testcase Format

Patrick Lam

(09/27) Note that I've changed dashes to underscores below.

Please hand in your test case as a `.zip` file. This `.zip` file should contain the following items:

1. `README`: a plain text file. This file should include your name and describe the contents of your test cases. The markers will use this file to evaluate your test cases.
2. `${userid}-[1-6].adl`: ADL test cases.
3. `${userid}-[a-zA-Z0-9].{atom,txt,xml}`: any required test inputs for your ADL test cases.
4. `expectedOutput/${userid}-[a-zA-Z0-9].{atom,txt,xml}` : expected test outputs from your ADL test cases.

The test harness will compare the contents of the `output` directory to the `expectedOutput` directory as described in the assignment sheet: `atom` and `txt` output files will be compared with the standard GNU `diff` tool. We will run `diff` with the `-w` (ignore all white space) option. `xml` output files will be compared with the `diffxml` tool (<http://diffxml.sf.net/>).
